Layers

Miscellaneous

I examined `Binary_Data` containing 4,320 bits of binary digits (0s and 1s). Grouping by 8 bits gave 540 bytes decoding to a Base64 stream.

Decoding revealed a password-protected RAR5 archive. Using the clue string `stormstorm` as the password extracted a text file containing an encoded string.

The extracted text `u`?c={J0*~F0v_E0`%0P/P` had printable ASCII values in the 33–126 range. Applying ROT47 decryption mapped the characters back to plaintext.

Finally, I tested the recovered flag against the executable / service:

`python3 Layers.py`

ROT47 transformation inverted successfully.

Flag Captured

`SecLeaf{F1n4lLy_YOu_G0t_1T_!^!}`
